FEVER PANEL - ADVANCE

TYPHI DOT/ SALMONELLA TYPHI IgM (ICT)	Negative
---------------------------------------	----------

Interpretation

RESULT	REMARKS
Reactive	Indicates presence of IgM antibodies against salmonella typhi.
Non-Reactive	Indicates absence of IgM antibodies against salmonella typhi.

Note:

1. Its positivity in serum indicates ongoing or recent infection by Salmonella typhi and the diagnosis should be confirmed by gold standard test such as Blood culture prior to start of antibiotics.
2. IgM antibodies are typically detectable 5-7 days post symptom onset, peaking in 2nd week and frequently remain elevated for 2-4 months following infection.
3. False positive results may be due to cross reactivity with other Salmonella spp., Dengue virus infection & in patients with high levels of Rheumatoid factor.
4. False negative reaction may be due to processing of sample collected early in the course of disease, antibiotic treatment during 1st week and immunosuppression.
5. Test conducted on serum.

Use

- To diagnose infection due to Salmonella typhi (Enteric fever).

MALARIA , P.VIVAX AND P.FALCIPARUM ANTIGEN (ICT)

Plasmodium falciparum antigen	Not Detected
Plasmodium vivax antigen	Not Detected

- Note:**
1. In the gametogony stage, P.falciparum may not be secreted. Such carriers may show falsely negative result
 2. This test is used to indicate therapeutic response. Positive test results 5-10 days post treatment indicate the possibility of a resistant strain of malaria
 3. Test conducted on EDTA whole blood

Comments

Malaria is a protozoan parasitic infection, prevalent in the Tropical & Subtropical areas of the world. Four species of plasmodium parasites are responsible for malarial infections in humans viz. P.falciparum, P.vivax, P.ovale & P.malariae. Falciparum infections are associated with Cerebral malaria and drug resistance whereas vivax infection is associated with high rate of infectivity and relapse. Differentiation between P.falciparum and P.vivax is of utmost importance for better patient management and speedy recovery.

AST (SGOT), SERUM (IFCC without P5P)	34.0	U/L	13.00 - 35.00
ALT (SGPT), SERUM (IFCC without P5P)	15.0	U/L	7.00 - 35.00
C-REACTIVE PROTEIN; CRP, SERUM (Immunoturbidimetry)	54.77	mg/L	<5.00

Comments

CRP is an acute phase reactant which is used in inflammatory disorders for monitoring course and effect of therapy. It is most useful as an indicator of activity in Rheumatoid arthritis, Rheumatic fever, tissue injury or necrosis and infections. As compared to ESR, CRP shows an earlier rise in inflammatory disorders which begins in 4-6 hrs, the intensity of the rise being higher than ESR and the recovery being earlier than ESR. Unlike ESR, CRP levels are not influenced by hematologic conditions like Anemia, Polycythemia etc.
